

1 Introduction

- **TODO:** which complexity is extracting an OMUS ?

2 Background

The algorithm presented in this section is based on the key ideas and observations of Ignatiev et al. presented in [Ignatiev et al., 2015]. The algorithm is adapted to incorporate an optimality criterion in order to guide the search not in the direction of the SMUS, but towards the OMUS. To do so, we first define the objective function f :

Definition 1. Given a CNF Formula \mathcal{F} , let $f : 2^{\mathcal{F}} \rightarrow \mathbb{R}$ be a mapping of a set of clauses to a real number. f is said to be a consistent objective function if for any subsets \mathcal{A}, \mathcal{B} of \mathcal{F} if $\mathcal{A} \subseteq \mathcal{B}$ then $f(\mathcal{A}) \leq f(\mathcal{B})$. *function f is said to be set increasing if ...*

For an unsatisfiable CNF formula \mathcal{F} , a subset of clauses that are still unsatisfiable, but if any of the clauses are removed then the reduced formula becomes satisfiable. Formally, we define this set as a Minimum unsatisfiable Subset (MUS):

Definition 2. A subset $\mathcal{U} \subseteq \mathcal{F}$ is a **minimal unsatisfiable subset (MUS)** if \mathcal{U} is unsatisfiable and $\forall \mathcal{U}' \subset \mathcal{U}$, \mathcal{U}' is satisfiable. An MUS of \mathcal{F} with an optimal value w.r.t an objective function f is called an **optimal MUS (OMUS)**.

Definition 3. A subset \mathcal{C} of \mathcal{F} is an **minimal correction subset (MCS)** if $\mathcal{F} \setminus \mathcal{C}$ is satisfiable and $\forall \mathcal{C}' \subseteq \mathcal{C} \wedge \mathcal{C}' \neq \emptyset$, $(\mathcal{F} \setminus \mathcal{C}) \cup \mathcal{C}'$ is unsatisfiable.

Definition 4. A satisfiable subset $\mathcal{S} \subseteq \mathcal{F}$ is a **Maximal Satisfiable Subset (MSS)** if $\forall \mathcal{S}' \subseteq \mathcal{F}'$ s.t $\mathcal{S} \subseteq \mathcal{S}'$, \mathcal{S}' is unsatisfiable.

An MSS can also be defined as the complement of an MCS (and vice versa). If \mathcal{C} is a MCS then $\mathcal{S} = \mathcal{F} \setminus \mathcal{C}$ is a MSS. On the other hand, MUSes and MCSes are related by the concept of minimal hitting set.

Definition 5. Given a collection of sets Γ from a universe \mathbb{U} , a hitting set on Γ is a set such that $\forall S \in \Gamma, h \cap S \neq \emptyset$.

Proposition 1. Given a CNF formula \mathcal{F} , let $MUSes(\mathcal{F})$ and $MCSes(\mathcal{F})$ be the set of all MUSes and MCSes of \mathcal{F} respectively. Then the following holds:

1. A subset \mathcal{U} of \mathcal{F} is an MUS iff \mathcal{U} is a minimal hitting set of $MCSes(\mathcal{F})$
2. A subset \mathcal{C} of \mathcal{F} is an MCS iff \mathcal{C} is a minimal hitting set of $MUSes(\mathcal{F})$

3 Explanation Generation

4 OMUS Algorithm

Note that if we assign a unit weight to every element in the subset, we reduce the problem of finding an OMUS to finding a SMUS.

Definition 6. Let Γ be a collection of sets and $HS(\Gamma)$ the set of all hitting sets on Γ and let f be an valid objective function. Then a hitting set $h \in \Gamma$ is said to be an **optimal hitting set** if $\forall h' \in HS(\Gamma)$ we have that $f(h) \leq f(h')$.

Property 1. The **optimal hitting set** of a collection of sets Γ is denoted by $OHS(\Gamma)$.

The algorithm is based on the following observation:

Algorithm 1: CSP-Explain(\mathcal{T} , f [, \mathcal{I}_0])

```
input      :  $\mathcal{T}$  set of constraints
input      :  $f$  a consistent objective function
optional input:  $\mathcal{I}_0$  a partial interpretation
output     : Explanation sequence
1 begin
2    $\mathcal{I} \leftarrow \mathcal{I}_0$  // Initial partial interpretation
3    $\mathcal{I}_{end} \leftarrow \text{propagate}(\mathcal{I}, \mathcal{T})$  // Goal state
4    $Seq \leftarrow \text{empty set}$  // explanation sequence
5   while  $\mathcal{I} \neq \mathcal{I}_{end}$  do
6      $\mathcal{F} \leftarrow \mathcal{I}_{end} \setminus \mathcal{I}$ ; // Facts to be derived
7      $\mathcal{F}' \leftarrow \{\neg \mathcal{F}\}$ ; // Set with all negated literals of  $\mathcal{F}$ 
8     //
9     // Propagate all negated literals OMUS finds the smallest explanation
10    //
11     $X \leftarrow \text{OMUS}(\mathcal{F}' \wedge \mathcal{I} \wedge S)$ ;
12     $E \leftarrow \mathcal{I} \cap X$ ; // Explanation used
13     $\mathcal{N} \leftarrow \text{propagate}(E \wedge S)$ ; // Newly derived facts
14     $\mathcal{I} \leftarrow \mathcal{I} \cup \mathcal{N}$ ; // Update known facts
15    //
16    // Add explanation for newly derived facts to explanation sequence
17    //
18    for  $n \in \mathcal{N}$  do
19      |  $(E_n, S_n, n)$  to  $Seq$ ;
20    end
21  end
22 end
```

Proposition 2. *A set $\mathcal{U} \subseteq \mathcal{F}$ is an OMUS of \mathcal{F} if and only if \mathcal{U} is an optimal hitting set of $\text{MCSES}(\mathcal{F})$*

Lemma 1. *Let $\mathcal{K} \subseteq \text{MCSES}(\mathcal{F})$. Then a subset \mathcal{U} of \mathcal{F} is an OMUS if \mathcal{U} is a optimal hitting set on \mathcal{K} and \mathcal{U} is unsatisfiable*

Algorithm 2: $\text{OMUS}(\mathcal{F}, f [, \mathcal{H}_0])$ [Ignatiev et al., 2015]

```

input           :  $\mathcal{F}$  a CNF formula
input           :  $f$  a cost function
optional input:  $\mathcal{H}_0$  initial collection of disjoint Minimum Correction Sets
output          :  $\text{OMUS}(\mathcal{F})$ 
1 begin
2    $\mathcal{H} \leftarrow \mathcal{H}_0$  ;
3   while true do
4       // cost minimal hitting set w.r.t cost function f
        $h \leftarrow \text{OHS}(\mathcal{H}, f)$ ;
       // set with all unique clauses from hitting set
        $\mathcal{F}' \leftarrow \{c_i | e_i \in h\}$  ;
5       if not SAT( $\mathcal{F}'$ ) then
6           | return  $\text{OMUS} \leftarrow \mathcal{F}'$  ;
7       end
       // written as  $\text{grow}(\mathcal{F}')$  which is Minimum Correction Set of  $\mathcal{F}'$ 
       // find the biggest one with the biggest cost
9        $\mathcal{C} \leftarrow \mathcal{F} \setminus \mathcal{F}'$  ;
10       $\mathcal{H} \leftarrow \mathcal{H} \cup \{\mathcal{C}\}$  ;
11  end
12 end

```

For the set of clauses $\mathcal{C} = \{c_1, \dots, c_{|\mathcal{C}|}\}$ with weights $\mathcal{W} = \{w_1, \dots, w_{|\mathcal{C}|}\}$ in the collection of sets \mathcal{H} . For Example:

$$\begin{aligned}\mathcal{C} &= \{c_1, \dots, c_6\} \\ \mathcal{W} &= \{w_1 = 20, w_2 = 20, w_3 = 10, w_4 = 10, w_5 = 10, w_6 = 20\} \\ \mathcal{H} &= \{c_3\}, \{c_2, c_4\}, \{c_1, c_4\}, \{c_1, c_5, c_6\}\end{aligned}\tag{1}$$

The optimal hitting set can be formulated as an integer linear program.

$$\min \sum_{i \in \{1..|\mathcal{C}|\}} w_i \cdot x_i \tag{2}$$

$$\sum_{i \in \{1..|\mathcal{C}|\}} x_i \cdot h_{ij} \geq 1, \forall j \in \{1..|\mathcal{H}|\} \tag{3}$$

$$x_i = \{0, 1\} \tag{4}$$

- w_i is the input cost/weight associated with clause i in
- x_i is a boolean decision variable if constraint/clause c_i is chosen or not.
- Equation 3, h_{ij} is a boolean input variable corresponding to if constraint/clause i is in set to hit j .

5 Future Work
